General Dental Practice Residency

Providing Comprehensive Post-Graduate Education
The one year (second year optional) General Practice Residency program sponsored by New York Medical College is accredited by the ADA Commission on Dental Accreditation. The program has three clinical training sites and fulfills the New York State requirements for licensure by PGY-1 training as well as the mandated 1 year post-doctoral year. A total of 10 residents per academic year are accepted. Patient care is comprehensive and is kept within the concepts of general dental practice in both a hospital and ambulatory practice environment. The program offers both didactic and clinical training in the disciplines of restorative dentistry, prosthodontics, periodontics, endodontics, pediatric dentistry, oral and maxillofacial surgery, anesthesiology, inpatient care, medical assessment, pain/anxiety control, medically compromised and special needs. These disciplines will be experienced in the outpatient suites, inpatient floors, emergency department and operating room areas of our clinical training sites. The didactic portion of the program will occur both on and off site, and will include formal lectures and presentations, informal seminars and conferences, as well as videoconferences and webinars, within the New York Medical College resource system.

Resident training occurs under the preceptorship of the attending Faculty staff, which is comprised of general practitioners as well as specialists.

The Standards for General Practice Residency of the American Dental Association are the underlying basis for the training program.

The General Practice Residency Program provides the following experiences:
- Comprehensive, specialty, and emergency oral health care for both ambulatory and admitted hospital patients.
- Dental management of medically compromised patients.
- Communication with patients and their families to help promote the highest level of care and to increase multi-cultural competency.
- Dental and hospital admissions, history and physical examinations, and writing admissions orders.
- Interrelation of oral health and medical disorders as well as how to diagnose and manage these cases.
- A multi-disciplinary approach to dental care by interacting with different hospital departments.
- Knowing when, where, and how to obtain medical consults from other departments prior to dental management.
- Effective dental practice management and working with dental auxiliary personnel.
- Management of patients under conscious sedation and general anesthesia.
- Participation in community services.

The New York Medical College General Practice in Dentistry residency program participates in the PASS and MATCH programs. Applicants must have graduated from an ADA/CODA accredited U.S. or Canadian dental school.

Salary & Benefits
The annual salaries of dental residents in the New York Medical College program are competitive with those offered at other programs in the New York metropolitan region. Information on resident salaries and benefits are available upon request.
